

Hydrogen Determination in Steel

with ELEMENTRAC[®] ONH-p series

Excellent measuring results!

ELTRA

Hydrogen determination in steel with the ELEMENTRAC ONH-*p* series

Hydrogen influences the mechanical properties of steel in a significant way. Due to the risk of hydrogen embrittlement, a precise and reliable determination is recommended particularly for stainless steel products. For comprehensive hydrogen determination ELTRA offers the H-500 and ELEMENTRAC ONH-*p* series.

The resistance furnace of the **H-500** provides temperatures up to 1000 °C and is used for the determination of the diffusible hydrogen content or, in some cases, for the determination of the total hydrogen content through thermal heat extraction.

The **ELEMENTRAC ONH**-*p* series uses an electrode furnace at temperatures up to 3000 °C and is available in different configurations. It may be used exclusively for hydrogen measurement or in conjunction with oxygen and nitrogen measurement by inert gas fusion.

The ELEMENTRAC ONH-p series is perfectly suited for hydrogen determination thanks to the following technical features:

Closed gas system

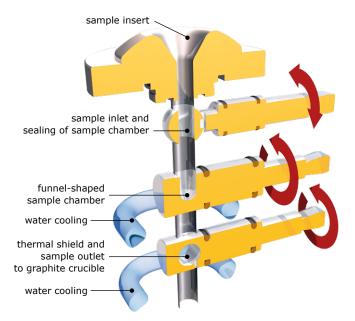

This gas management system ensures that no analyte is lost during measurement. A reduced carrier gas flow supports maximum sensitivity.

Water-cooled sample port system with additional heat shield

The combination of water cooling and thermal shield in the sample port system makes the ELEMENTRAC analyzers perfectly suited for sensitive hydrogen measurements because the heat input during purging and the resulting hydrogen loss is prevented. The heat shield opens shortly before the analysis starts and the sample falls from the rotating sample chamber into the hot graphite crucible.

Sensitive thermal conductivity cell

The innovative thermal conductivity cell provides a sensitive and robust measuring channel and allows reliable hydrogen determination over a wide concentration range.

furnace

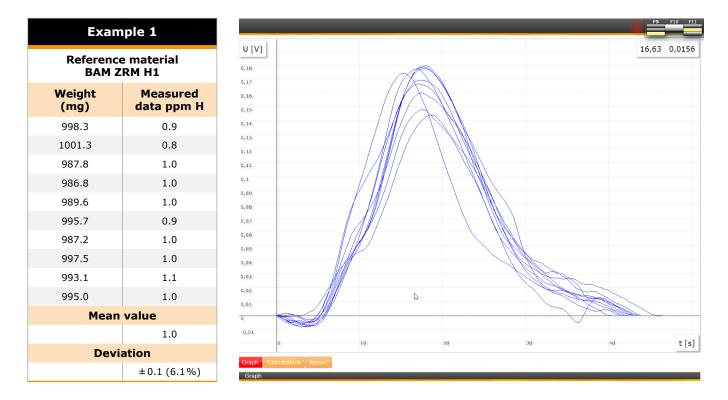

Please note

For a reliable determination of hydrogen, both sampling and sample preparation are very critical issues which are described in detail in the ASTM standard E 1806-09. With incorrect sampling and processing, the measured hydrogen content may show wide deviations over multiple measurements.

In the following, some exemplary measurements of the ELEMENTRAC ONH-*p* series are shown:

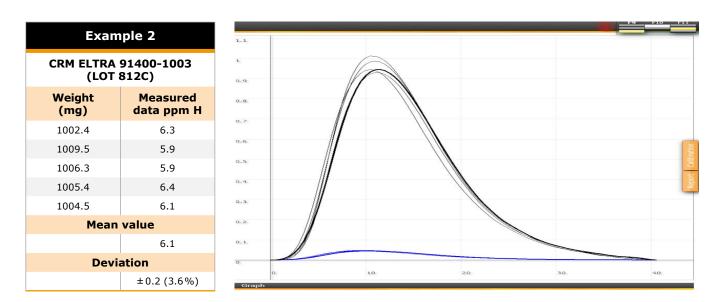

Example 1: Reference material BAM ZRM H1

Certified value 0.97 ppm H (±0.1 ppm)

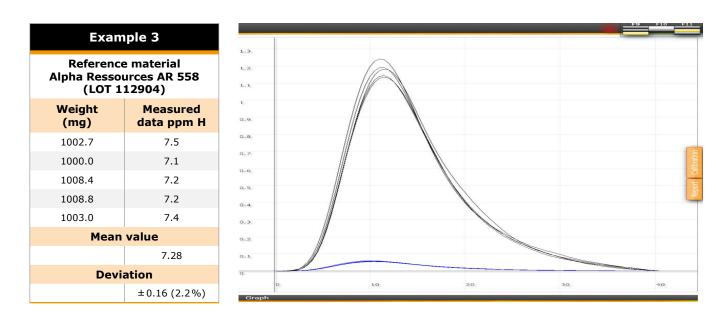

Example 2: CRM ELTRA 91400-1003 (LOT 812C)

Certified value 6.0 ppm H (± 1 ppm)

Example 3: Reference material Alpha Ressources AR 558 (LOT 112904)

Certified value 7.3 ppm H (\pm 0.6 ppm)

Example 4: Steel discs used in the automotive industry (customer samples)

Beside steel pins of 1 g, samples with lower weights can be analysed as well:

Example 4a				
uncleaned disc				
Weight (mg)	Measured data ppm H			
220.7	2.78			
229.7	2.92			
241.8	2.63			
214.8	2.92			
186.0	3.83			
Mean value				
3.02				
Deviation				
±0.47 (15%)				

Example 4b					
cleaned disc					
Weight (mg)	Measured data ppm H				
345.5	2.52				
342.9	2.43				
343.4	2.28 2.22				
345.5					
340.0	2.57				
Mean value					
2.40					
Deviation					
	±0.15 (6%)				

Example 4c					
cleaned and hardened disc					
Weight (mg)	Measured data ppm H				
344.0	1.84				
343.8	1.81				
343.0	1.99				
343.4	2.00				
344.9	2.20				
Mean value					
	1.97				
Deviation					
±0.16 (8%)
